# Overview

Cases of COVID-19 this week in Vermont increased again, growing from an average of 261 to 283 (+8.5%) cases per day over the last seven days while testing was flat.

Hospital admissions and inpatient numbers increased this week, with those hospitalized for COVID in Vermont growing 42% over the last seven days. However, the average number of Vermonters in the ICU has fallen this week, although low counts create instability in the percentage change. One more Vermonter has died of the virus. The total death toll is now 630 lives lost.

Regionally, Boston COVID-19 wastewater data started to trend down over the last week, though with school vacations fewer people may have been in metro Boston last week. National modeling projects cases may ease slightly in the coming weeks, perhaps signaling the Omicron BA.2 variant wave could begin to subside in the Northeast.
